[·]Cases are defined as:

a. any gunshot wound treated in a hospital emergency department (e.g., firearm, non-powder gun, other gun), orb. a sharp instrument wound intentionally inflicted by another person or sustained during a violent incident.

[•]All cases reported regardless of subsequent disposition are included in the counts (e.g., admitted, died, discharged, etc.).

[•]Counts do not reflect deaths that are not first transported to a hospital emergency department for treatment.

[•]Rates are calculated based on population estimates developed by the MA Institute for Statistics on Economic Research (1994-1998), the MA Department of Public Health (1999) and the U.S. Census Bureau (2000, 2001-2005 estimates).

¹ Based on past record reviews, the statewide hospital reporting level is estimated to be between 70 and 80%.

²WRISS captures gun-related injuries of any intent, but only sharp instrument wounds of an assaultive nature.

³ Most intentional self-inflicted firearm injuries result in death. They are less likely to be treated in an ED and consequently less likely to be captured by WRISS.
